

Appendix: Complex event definition compression

Let an event's composite definition be $e \triangleleft d$, and the complex event e^1 appear in d with $e^1 \triangleleft d^1$. Then the complex event e is said to be *refinement-connected* (or *r-connected* for short) to the definition d' . Similarly e is said to be r-connected to d^n if there exists an acyclic chain of r-connected relations where $e \triangleleft d$, with $e^1 \in A_d^c$ and $e^1 \triangleleft d^1$, and with $e^2 \in A_{d^1}^c$ and $e^2 \triangleleft d^2$, ... with $e^n \in A_{d^{n-1}}^c$ and $e^n \triangleleft d^n$. If $A^c = \emptyset$ in a given composite definition d , it is said to be *irreducible*.

Given $e \triangleleft d^1$ and an r-connected definition d^2 , then its flattened definition is $d^{1'} = \langle A_{d^{1'}}^p, A_{d^{1'}}^c, KL_{d^1}, L_{d^{1'}}, \preceq_{d^{1'}} \rangle$ of e where $A_{d^{1'}}^p = A_{d^1}^p \cup A_{d^2}^p$, $A_{d^{1'}}^c = A_{d^1}^c \cup A_{d^2}^c$, $KL_{d^{1'}} = KL_{d^1} \cup KL_{d^2}$.

The generation of an event's flattened definition refinements involves expanding its set of complex events, primitive events, context relation literals, partial orders and labels with those appearing its r-connected definitions, and the addition of a set of partial order relation over the maximal labels of the re-connected definition and the event it defines. See Algorithm 1. We assume that every complex event in an event's composite definition (and its r-connected definition) is r-connected to an irreducible composite definition. We further consider that a complex definition is associated with a single complex event, and that each label in definition is unique with respect to the set of labels appearing in definitions \mathcal{D} .

Algorithm 1 generates a set of partial orders $\Phi = \{d_1, \dots, d_2\}$, associated with a complex events from an event's composite definition $e \triangleleft d$, taking into account all possible partial orderings over the maximal labels of its partial order \preceq_d . Each element d_i comprises all the primitive events, complex events and context relation literals that appear in every r-connected definition.

Algorithm 2 outlines a recursive function that returns for a given complex event e and label l , (a) an composite definition whose complex events, primitive events, context relation literals, assignments and labels are expanded with those appearing in its r-connected definitions, and (b) a set of partial orderings over the maximal labels appearing in its definition and l . The function *find_complex_definition* returns a single definition d such that $e \triangleleft d$ and $d \in \mathcal{D}$.

The function *find_maximals* (lines 9 and 29) returns, for a given set of labels and partial order over these, the set of maximal labels. The function *fix_order* (lines 10 and 30) creates a set of partial order sets $\{\phi_i\}$, one for each maximal label l' in ML , such that for all $l_j \in ML$ where $l_j \neq l'$, $l_j \preceq l' \in \phi_i$ and where $l \notin ML$, it includes $l' = l \in \phi_i$. The function *update* (line 20) updates the set of partial order sets, appending each element with $\phi_i \in FD$ and the partial orders $\preceq_{d'}$ and \preceq_v . *create_compressed_sets* (line 31) produces a new set of partial orders by considering each of the partial orders over the maximal labels of the current definition and

Algorithm 1 *Generate set of flat refinements set for composite definition*

```

1:  $\mathcal{D}$ : Set of composite definitions
2:  $d$ : Composite definition in  $\mathcal{D}$ 
3:  $\Phi$ : Flat refinements  $\{d_1, \dots, d_n\}$ 
4:
5: function  $\delta(d)$ 
6:    $ML \leftarrow \text{find\_maximals}(\preceq_d, L_d)$ 
7:    $\Phi = \emptyset$ 
8:   for all  $l \in ML$  do
9:      $(v, FD) \leftarrow \text{compress\_definition}(d, l)$ 
10:     $v.\lambda = v.\lambda$ 
11:    for all  $f \in FD$  do
12:       $\Phi = \Phi \cup \langle v.\mathcal{A}^p, v.\mathcal{A}^c, v.KL, v.L, v.\preceq \cup f, v.\lambda \rangle$ 
13:    end for
14:  end for
15:  return  $\Phi$ 
16: end function

```

those in *poe*. The final number of elements Φ is bound by the product of the number of maximal labels in each r-connected definitions.

Algorithm 2 *Compress definitions for complex events*

```
1:  $d$ : composite definition
2:  $l$ : label
3:  $\mathcal{A}^c$ : Set of complex events
4:  $\mathcal{D}$ : Set of composite definitions
5:  $\triangleleft$ : Set of composite definitions relations
6:
7: function COMPRESS_DEFINITION( $d, l$ )
8:   if irreducible( $d$ ) then
9:      $ML \leftarrow \text{find\_maximals}(\preceq_d, L_d)$ 
10:     $FD \leftarrow \text{fix\_order}(ML, l)$ 
11:    return ( $d, FD$ )
12:   else
13:      $d' = d$ 
14:      $poe = \emptyset$ 
15:     for all  $nl \in L_{d'}$  do
16:       for all  $c \in \lambda_{d'}(l)$  do
17:         if  $c \in \mathcal{A}_{d'}^c$  then
18:            $v \leftarrow \text{find\_complex\_definition}(c, \triangleleft, \mathcal{D})$ 
19:            $(v', FD) \leftarrow \text{compress\_definition}(v, nl)$ 
20:            $poe \leftarrow \text{update}(poe, \preceq_{d'}, \preceq_{v'}, FD)$ 
21:            $d'.\lambda = d'.\lambda \cup v.\lambda$ 
22:            $d'.L = d'.L \cup v'.L$ 
23:            $d'.A^p = d'.A^p \cup v'.A^p$ 
24:            $d'.KL = d'.KL \cup v'.KL$ 
25:            $d'.A^c = d'.A^c \cup v'.A^c$ 
26:         end if
27:       end for
28:     end for
29:      $ML \leftarrow \text{find\_maximals}(\preceq_{d'}, L_{d'})$ 
30:      $FD \leftarrow \text{fix\_order}(ML, l)$ 
31:      $poe \leftarrow \text{create\_compressed\_sets}(FD, poe)$ 
32:     return ( $d', poe$ )
33:   end if
34: end function
```
